Research Interests

My research is on state estimation, dynamic modeling, and control for the next generation of closed-loop mobile health (mHealth) interventions informed by sensor feedback. I develop data-driven digital twins and uncertainty-informed control algorithms that are tailored to mHealth interventions (e.g., non-invasive vagus nerve stimulation via earbuds), leveraging inductive biases for sample efficiency. My research on sensor informatics includes signal processing, machine learning, and uncertainty quantification algorithms that leverage biosensing and psychophysiological knowledge to better track latent state dynamics such as changes in stress. I also enjoy collaborating on translational research for clinical evaluation and impact.
